

### ABSTRACT

This project develops an AI-based system to detect plant diseases from leaf images. Users can scan or upload images, and the system predicts the disease with high accuracy. It also provides prevention methods and remedies. The system is fast, user-friendly, and supports smart agriculture.

### UNIQUENESS

- AI-based real-time disease detection
- Easy scan & upload, Voice feature
- Provides remedies and prevention tips
- Multilingual support (English, Telugu, Hindi)
- User-friendly mobile application

### METHODOLOGY

The system uses AI and deep learning (CNN) to analyze plant leaf images. Users can scan or upload an image, which is processed and classified into disease categories. The system then provides the disease name, confidence score, description, prevention methods, and remedies. Results are displayed instantly through the application.

### SOCIETAL USE

The system helps farmers detect plant diseases early and reduce crop loss. It provides easy access to disease information without needing experts. The application supports smart farming and improves agricultural productivity.

**SDG 12:** Responsible Consumption & Production
